

Kale Field Trial – Canterbury

This trial was designed to determine the effectiveness of AgroBioTechNZ product variations, against a control on Kale (Coleor), at Claverton Farm, Burnham, Canterbury.

This replicated field trial showed a statistically significant increase in yield was achieved by using AgroAzzo - 12.3t, over the control - 8.7t.

Economics

2 x applications of 4L/ha were applied at a cost of \$114/ha. The increase in yield was 3.6t with value of 28c/kg DM. This equates to an increase in Margin of \$1008 minus product cost of \$114 = total increase in profit of \$894 per ha.
